

# Support the security of your site, people, and productivity, with Axis.

Operating a profitable mine is challenging. The nature of the work, combined with isolated, hard-to-reach locations, exposure to dust, wind, extremes of hot and cold. It can be difficult to maximize productivity while minimizing risks to personnel, and also protect the site itself against intrusion, theft, sabotage and other threats.

## **One partner, multiple opportunities**

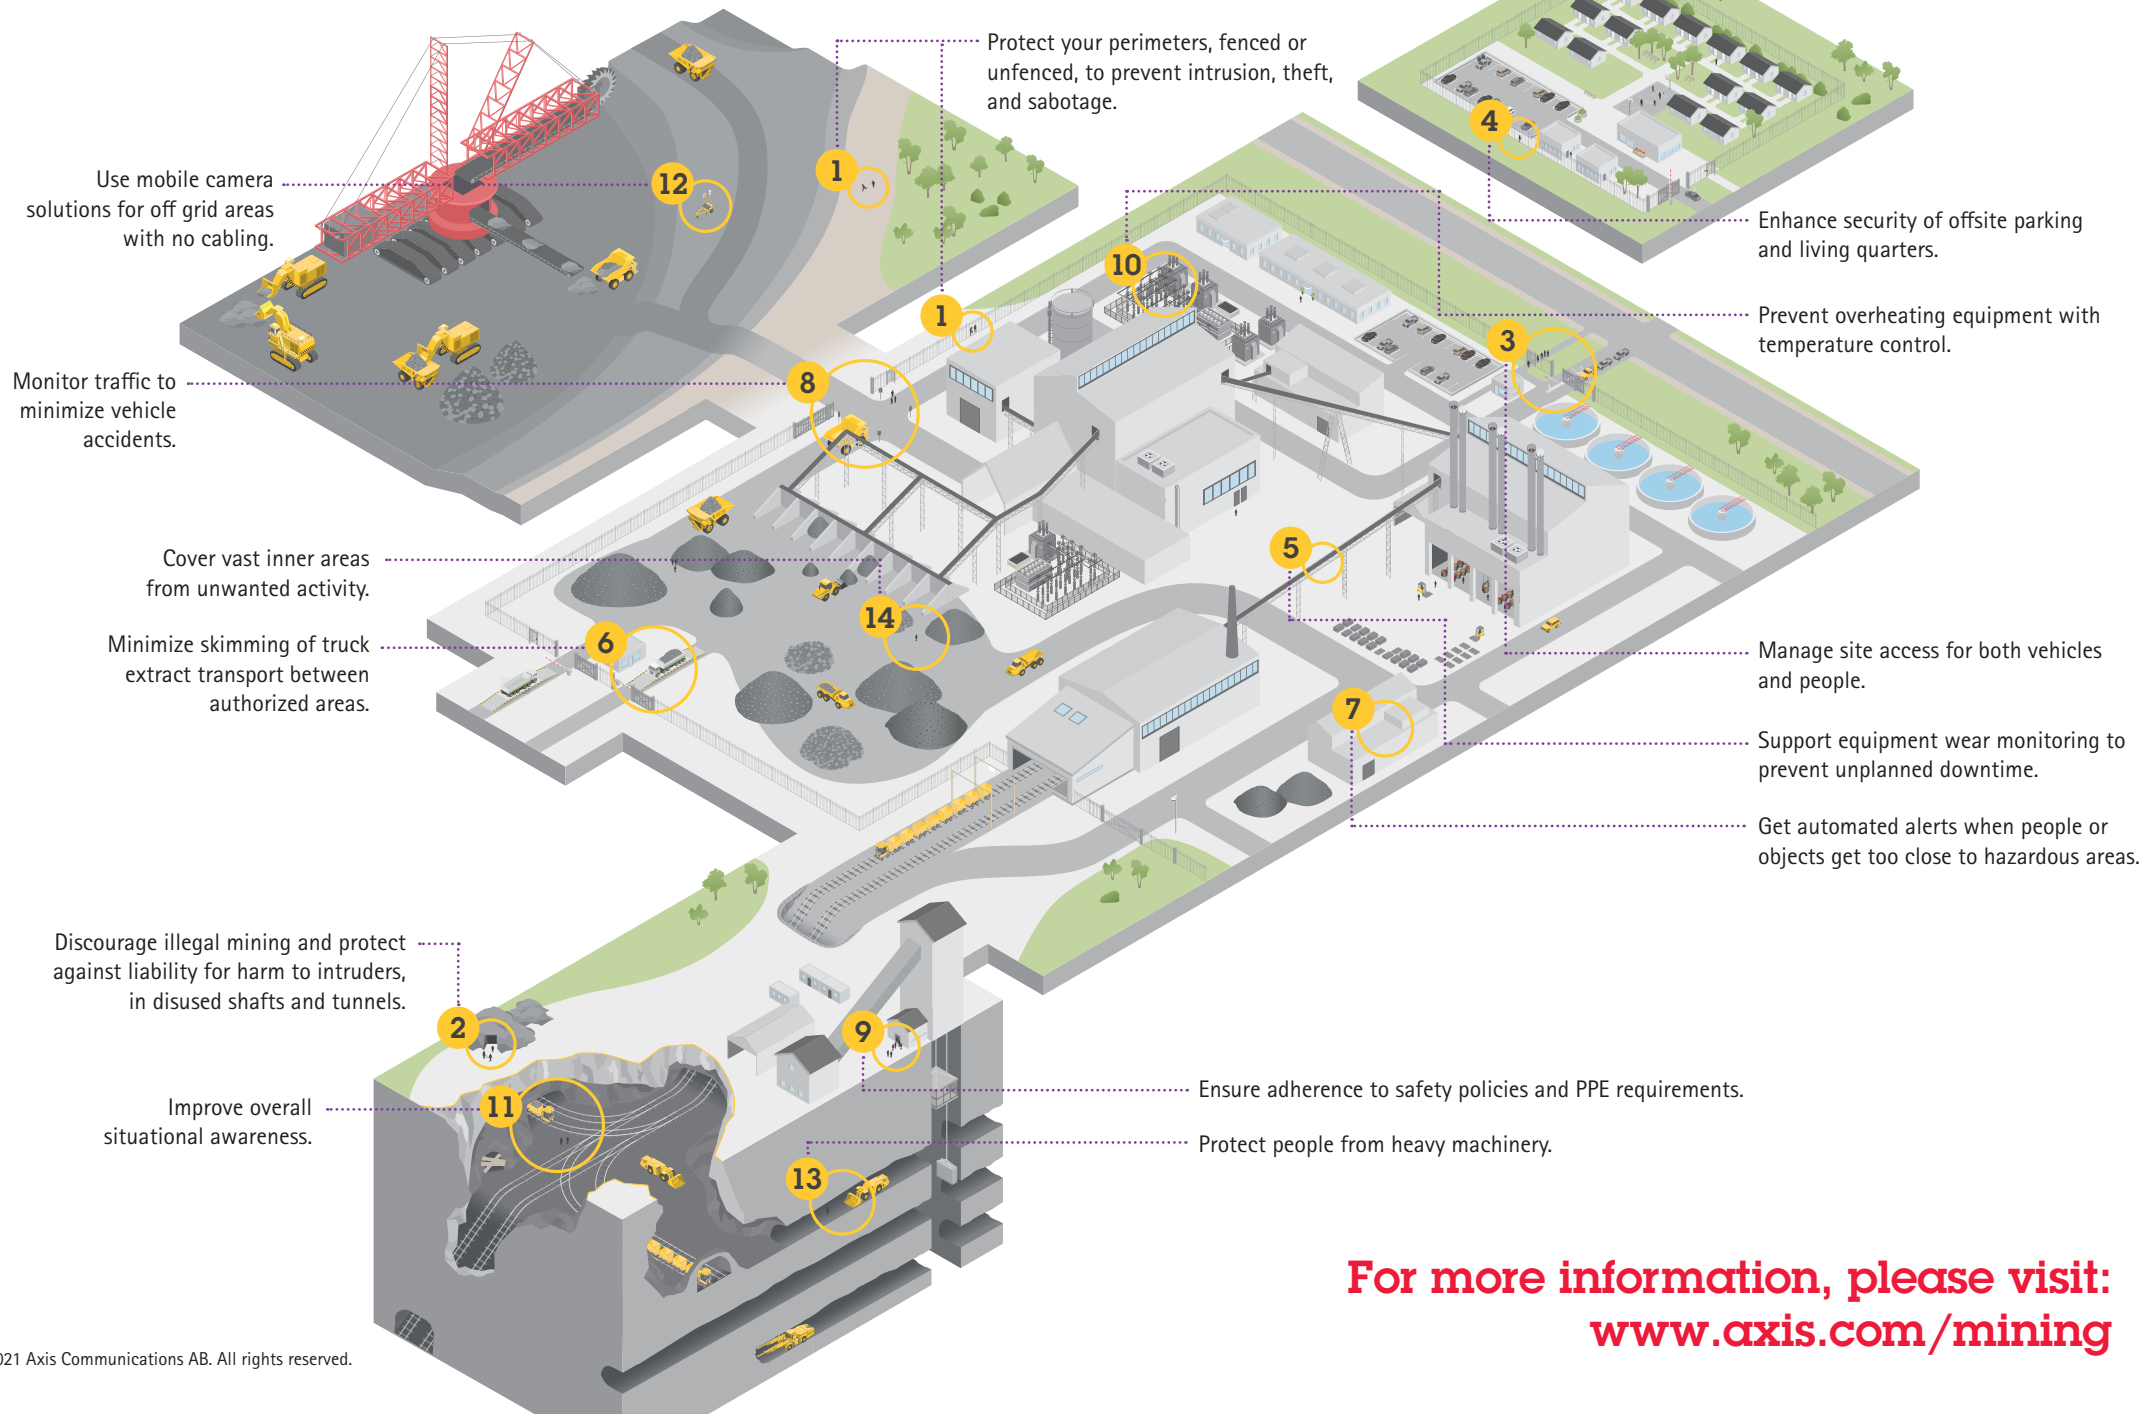

Axis has extensive experience in helping mining and industry clients operate safely, securely and profitably in demanding environments. Our solutions not only provide ongoing oversight of your perimeters, operational areas and infrastructure, verifiable in real time from a single control room or mobile device. They also enable visual confirmation of your equipment's sensor data to support operational efficiency. And, they bring additional health and safety capability enhancements to your current system, giving first responders and emergency personnel pertinent data to speed response times, creating more opportunities to help keep your people safe. Also, clear and reliable recordings assist post-incident investigation.

## **Axis works well with others**

Axis technologies are designed to integrate easily with your existing systems and tools—letting you increase security, maintenance and safety capabilities while building on your previous investments. Installation often requires little if any operational downtime, and Axis systems are easy and intuitive to understand and operate.
